

February 2025 Seminar

Our first pragmatic seminar of the year happened from the 4th to 6th of February.

We have welcomed our Italian and Greek distributors over 3 days to review a synthesis of the current biophysics of cosmetic functions in formulas:

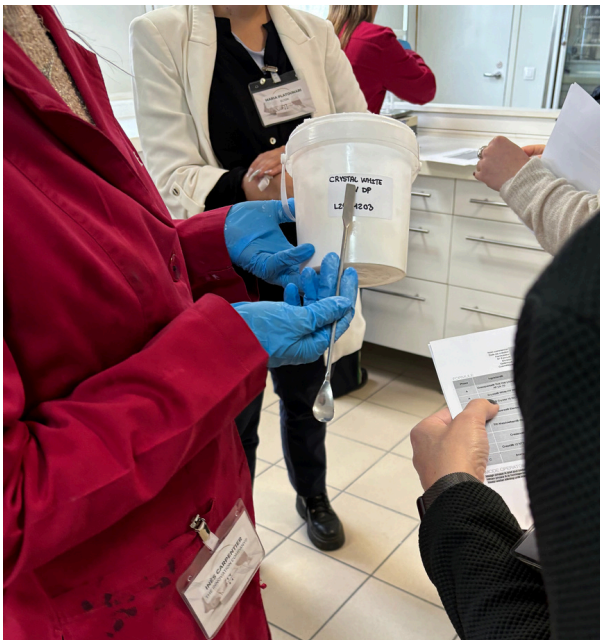

- 1- Protection of the body interface skins types and hair.
- 2- Prevention of the poor to bad ingredients for the skins and hairs photo-types (0 to 6).
- 3- Pre-Emptive or what was called before Active Cosmetic Ingredients (of which so few actually exist for day care), but richer for the night care time.

Protection is well from Photons Electromagnetic ranges from 280 nm to 540 nm wavelength. And simply why minerals are superior and safer than all organic attempts to protect live dermal cells. Just common sense, you see where you are protected, and when no longer visible you are no longer protected. You also never have any BDC issues, as more current research shows with master new RMI (Resonance Magnetic Imagery) at close to 12 Tesla power levels. BDC is Brain Degenerative Concern.

Prevention is well the following:

- A- Photostability as in the EU ISO 24443:2 test method under Xenon light tests of two sessions of exposures
- B- Oxygen stability as with the Oxygen Stability Index analyser.
- C- Allergens new lists of over 83 olfactive materials (all from naturals, see above wokism).
- D- Osmose value in context of the flow of human plasma levels (280 and 310 mOsm/L).
- E- Surface tension and above values of 17. Super lipophobic emollients are of course very long-lasting Half-Life.
- F- For skin diffusion or hair diffusion is better to be a negative charge at over - (minus) 35 Millivolts at Plasma pH level of 7.38.

And quite a few analyses as Biomodulations that have been tested during the Seminar three days.

Pre-Emptive ACI, well we are looking at very few active in day time Colours pigments are UVR protective but also have an interface electromagnetic effect.

Any emollient that has improved energy or relaxing microcirculations functions.

And an example of an Equafarm® RetilNew® where a new limit of only 0.3% Retinol or Retinal with added co-energy (energizing) bring us to the levels of the original 3%, with just about 20% more energizing levels.

After all, skin enhancement is just bio-physics.

Only in In Vitro or Ex-vivo test methods do cells, responds to stimulation, as no plasma immune elements fight off the pseudo active.

We have been showing these under formulations comparisons along with other, yes, stupefying tests!
